

Electric Vehicle Use Estimates

NEVI Program Management
Wyoming Department of Transportation

March 21, 2023

FINAL

Daily Long-Distance Trips

The U.S. Department of Energy estimates that roughly 80% of all electrical vehicle (EV) charging occurs at home.¹ However, there are a number of reasons why an EV owner or operator may need to charge their vehicle outside of the home, one of which is to charge for long-distance travel. Although it is unknown whether the charging-at-home trend will continue, one of the key focuses of the Bipartisan Infrastructure Law is to specifically build out a national fast charger network along interstates and Alternative Fuel Corridors (AFC) to support long-distance travel and reduce EV range anxiety.

The probability that an EV will need to stop and use a charging station is dependent on several factors, not the least of which is the range of the vehicle and its charge status. Other factors include personal preference, needing or wanting to stop at a convenience or rest stop, stopping to use amenities or to visit an attraction, and other similar reasons. All of these factors can influence the potential that an EV operator uses a Direct Current Fast Charger (DCFC) at a given roadside location. However, the National Electric Vehicle Infrastructure (NEVI) Program uses distance traveled relative to the current range of EVs on the market as the overriding factor for estimating potential use.

According to the Electric Vehicle Database,² the average range of the available EVs on the market is approximately 211 miles. If the charger spacing averages every 50 miles, the probability of stopping at a given NEVI Program site is equal to Distance Between Sites/Average EV Range (50/211).

Methodology

HDR extracted Replica trip data³ from Wyoming and the surrounding states to determine the number of such long-distance trips per day that occurred on the AFCs in Wyoming. This information was obtained through analysis of Replica's Origin/Destination data, which includes data from a number of different sources, such as cellphone "pings," traffic counters, probe vehicles, and others. HDR processed the Origin/Destination data extracted from Replica within a GIS platform to assign travel to actual road segments based upon the Origin and Destination of the trips using the following methodology:

- a. Replica data was used to determine the number of passenger vehicle daily trips along AFCs (AADT for 2022)
 - Replica are activity-based travel models that simulate the complete activities and movements of residents, visitors, and commercial vehicles in a region and season on a typical day.
 - Replica generates its data by running large-scale, computationally intensive simulations.
 - Replica uses a composite of data sources which are a diverse set of third-party data from public and private-sector sources. These sources include five

¹ https://afdc.energy.gov/fuels/electricity_charging_home.html

² <https://ev-database.org/cheatsheet/range-electric-car>

³ <https://www.replicahq.com/>

categories of data: Mobile location data, Consumer/resident data, Built environment data, Economic activity data and Ground truth data.

- b. The number of daily trips were further segmented by the origin state and the length of trips.
- c. Daily trips which are at least 150 miles were considered as long-distance trips.

For each interchange, the Replica data was used to estimate the percentage of the AADT that could be attributed to EVs using the following formula:

$$EV\ AADT = \sum_{a=m} \{(\% \text{ of Traffic from State}_i) * (\% \text{ EV from State}_i)\} \\ * (\# \text{ Long Distance Trips at Interchange } j)$$

The percentage of EVs from each of the origin states was estimated from the EV adoption rates extracted from the Alternative Fuels Data Center (AFDC) 2021 adoption rates. All EVs are considered regardless of manufacturer. Table 1 summarizes the assumed adoption rate for each origin State.

Table 1. Estimated Percentage of EVs Among All Registered Vehicles

State of Origin for the Long-Distance Trip	EV Adoption Rate
Wyoming	0.80%*
Colorado	0.71%*
Nebraska	0.14%*
Montana	0.16%*
Idaho	0.19%*
South Dakota	0.08%*
Utah	0.57%*
Oregon	0.81%*
Washington	0.98%*
North Dakota	0.05%*
Kansas	0.17%*
California	1.61%*
Nevada	0.71%*

* from the Alternative Fuels Data Center (AFDC) 2021 adoption rates

Combining the estimates of EV AADT at each interchange with the probability of stopping at a given NEVI site provides an estimate of the number of daily charges per NEVI site as summarized by the following formulas:

$$\text{Probability of Stopping at a Given NEVI Site} = P(\text{EV Stop}) = \frac{\text{Distance Between Sites}}{\text{Average EV Range}}$$

$$\text{Estimate of Number of Daily Charges per NEVI Site} = \text{EV AADT} * (P(\text{EV Stop}))$$

Results

Usage of NEVI charging sites along Wyoming AFCs is estimated to be fairly modest for 2023 based upon the estimated number of EVs utilizing Wyoming's interstates. These numbers include Tesla. Therefore, all EVs and all EV infrastructure are considered regardless of the EV manufacturer. Figure 1 summarizes the estimated number of vehicles passing a sample of major Interstate interchanges within Wyoming (i.e., EV AADT). Table 2 provides both the estimated EV AADT and the estimated number of daily charges per NEVI Program site.

Figure 1. Estimated Number of EVs Passing Major Interstates Daily

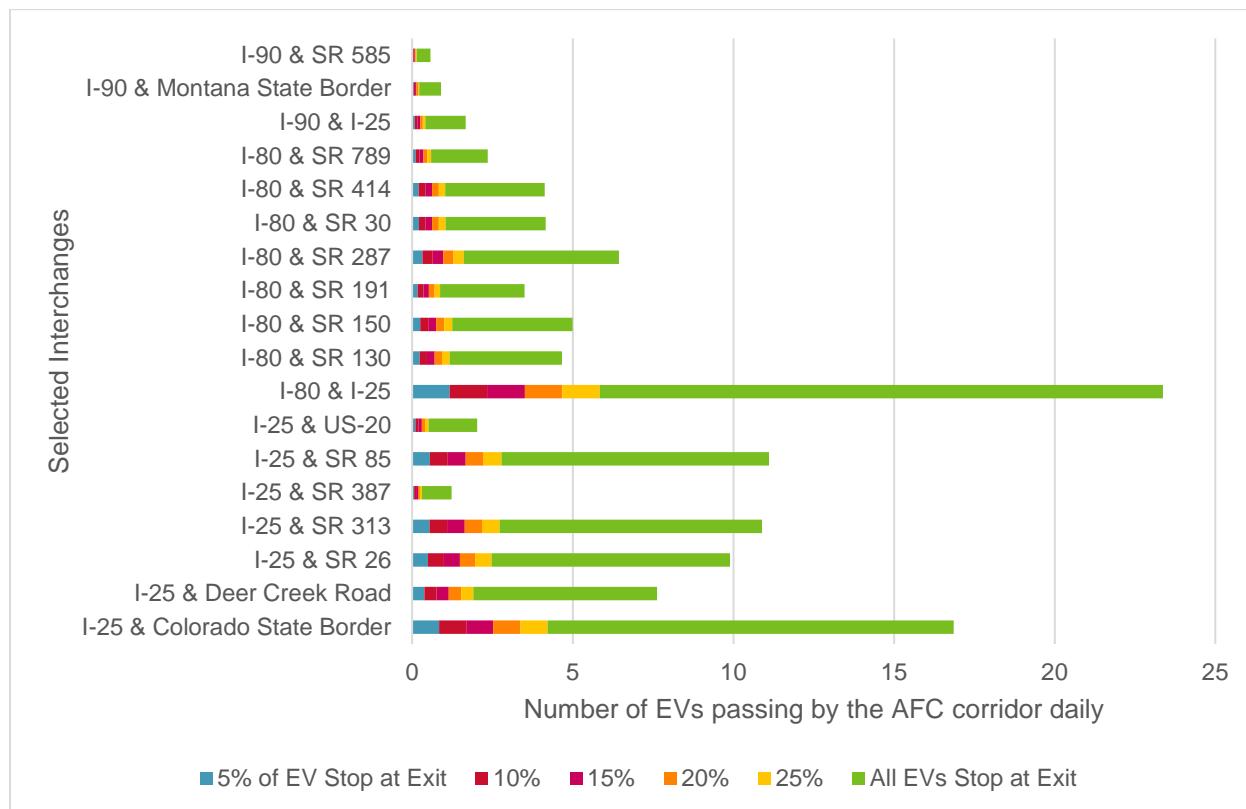

Table 2. Estimated Number of Charges per Day at Major Interchanges Based on Estimated AADT

AFC	Interchange	Total Private Auto Trips (Daily)	Long-Distance Private Auto Trips (Daily)	Long-Distance Private Auto Trips (EVs Only)	Estimated Number of Daily Charges per NEVI Site
I-25	Colorado State Border	17,860	4,727	17	3.99
I-25	Deer Creek Road	11,727	3,979	8	1.81
I-25	SR 26	7,297	4,464	10	2.34
I-25	SR 313	8,089	4,505	11	2.58
I-25	SR 387	2,563	1,427	1	0.29
I-25	SR 85	11,562	4,693	11	2.63
I-25	US-20	18,292	2,177	2	0.48
I-80	I-25	30,901	6,394	23	5.54
I-80	SR 130	4,133	2,565	5	1.11
I-80	SR 150	8,921	2,463	5	1.18
I-80	SR 191	17,983	2,062	3	0.83
I-80	SR 287	10,819	3,136	6	1.53
I-80	SR 30	5,295	2,164	4	0.99
I-80	SR 414	4,844	2,087	4	0.98
I-80	SR 789	3,694	1,780	2	0.56
I-90	I-25	6,076	1,864	2	0.39
I-90	Montana State Border	2,398	779	1	0.21
I-90	SR 585	3,226	695	1	0.14

As observed in Figure 1 and Table 2, the highest concentration of EV usage and, therefore, the estimated number of charges per NEVI station is heavily influenced by the expected adoption rates in Wyoming and the surrounding states. Interstate interchanges in the southeastern portion of the state for which EVs from Colorado are expected, have the highest estimated daily usage. Interstate interchanges in the northeastern portion of the state (I-90) adjacent to Montana and South Dakota have the lowest estimated daily usage. Interstate interchanges along I-80 in the south portion of the state have low, but slightly higher estimated daily usage due to their proximity to Salt Lake City, Utah and I-25.

For the estimated number of charges per day at all interchanges along AFCs, see Table 3. The seven city locations identified by the Wyoming Department of Transportation NEVI Deployment Plan for placement of NEVI program charging stations are shown at the top of Table 3.

Table 3. Estimated Number of Charges per Day at All Interchanges Based on Estimated AADT
